NTIN071 A&G: Tutorial 8 – Chomsky normal form, The CYK algorithm

Solve 1, 2ab, 3ab first (the rest is for practice).

Problem 1 (Useless symbols). Answer the following questions. Justify your answer.

- (a) Find an example of a grammar in which there is a generating variable only reachable via nongenerating variables.
- (b) When reducing a grammar, which variables do we need to remove first: nongenerating or unreachable?
- (c) Is it possible for a reachable generating variable to become nongenerating after the removal of unreachable variables?

Problem 2 (Convert to ChNF). Convert the following context-free grammar to Chomsky normal form:

(a)
$$G = (\{S, A, B\}, \{0, 1\}, S, \mathcal{P}) \qquad G = (\{S, A, B\}, \{0, 1\}, S, \mathcal{P}) \\ \mathcal{P} = \{S \to 0AB, \qquad \mathcal{P} = \{S \to 0A10B10, \\ A \to 0A0 \mid 11, \qquad A \to 1A0 \mid \lambda, \\ B \to 0\} \qquad B \to 1B00 \mid \lambda\}$$
(b)
$$G = (\{S, A, B\}, \{0, 1\}, S, \mathcal{P}) \qquad G = (\{S, E, F\}, \{(,), *, +, 1\}, S, \mathcal{P}) \\ \mathcal{P} = \{S \to A \mid 0SA \mid \lambda, \qquad \mathcal{P} = \{S \to (E), \\ A \to 1A \mid 1 \mid B1, \qquad E \to F + F \mid F * F, \\ B \to 0B \mid 0 \mid \lambda\}$$

Problem 3 (The CYK algorithm). Using the CYK algorithm determine if $w \in L(G)$.

(a)
$$w = 0110, G = (\{S, A, B\}, \{0, 1\}, S, \mathcal{P}),$$

$$\mathcal{P} = \{ S \to 0 \mid AB,$$

$$A \to 1 \mid SA \mid SB,$$

$$B \to AS \mid BA \mid 0 \}$$

(b)
$$w = abcbb$$
, $G = (\{S, A, B, C\}, \{a, b, c\}, S, \mathcal{P})$,
$$\mathcal{P} = \{S \to CA \mid CB, \\ B \to CBA \mid CB \mid BA \mid BB, \\ C \to ABC \mid BC, \\ A \to a, B \to b, C \to c\}$$

(c)
$$w = abcbb$$
, $G = (\{S, A, B, C\}, \{a, b, c\}, S, \mathcal{P})$,
$$\mathcal{P} = \{S \rightarrow CA \mid CB,$$

$$B \rightarrow CBA \mid CB \mid BA \mid BB,$$

$$C \rightarrow ABC \mid BC,$$

$$A \rightarrow a, B \rightarrow b, C \rightarrow c\}$$
